

RELATÓRIO DE CARATERIZAÇÃO DAS AREIAS DO VALE DA GAIA

1. Introdução

No âmbito do estudo geológico das areias do Vale da Gaia, foram caracterizadas e analisadas as areias dos depósitos aluvionares e antigas zonas de dragagem mineira. Para este fim, foram selecionadas amostras representativas e criada uma amostra composta para ensaio, esta foi identificada com o código B393386 e enviada para a Austrália (Laboratório interno de Metalurgia da ALS Global – Laboratório certificado) para ensaios de caracterização, entre os quais foram avaliados os parâmetros granulometria e química.

2. Classificação

A amostra foi peneirada a seco sobre uma pilha de telas de laboratório num agitador do tipo Rotap durante 10 minutos. Os dados de dimensionamento, granulometrias e curva granulométrica são apresentados na tabela e figura abaixo, e os dados totais no relatório oficial da ALS em anexo.

Tabela 1 Granulometrias recuperadas nas areias do Vale da Gaia.

Sample ID	SCREEN SIZE (um)	SCREEN WT(g)	% WT Distribution	% WT Passing
B393386 + 1400um	1400	1,9	0,37	99,63
B393386 + 1000um	1000	3,5	0,68	98,95
B393386 + 710um	710	15,4	3,01	95,94
B393386 + 500um	500	36,2	7,07	88,87

B393386 -63um	-63	74,7	14,59	

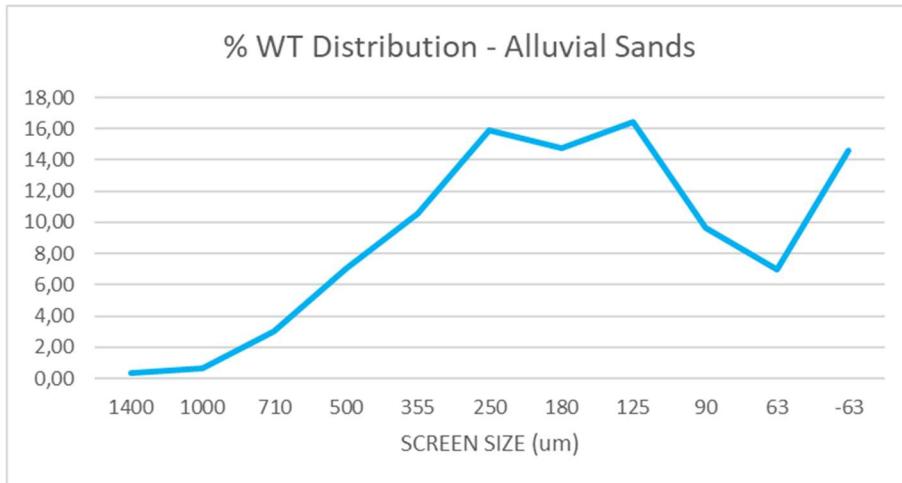

Figura 1 - Curva Granulométrica das areias do Vale da Gaia.

Cada fração foi objeto de análise química de elementos maiores e elementos traço, tendo-se encontrados uma distribuição equivalente em todos os elementos exceto o cálcio (CaO), como se pode observar na imagem seguinte. Os resultados globais podem ser consultados no relatório oficial da ALS em anexo.

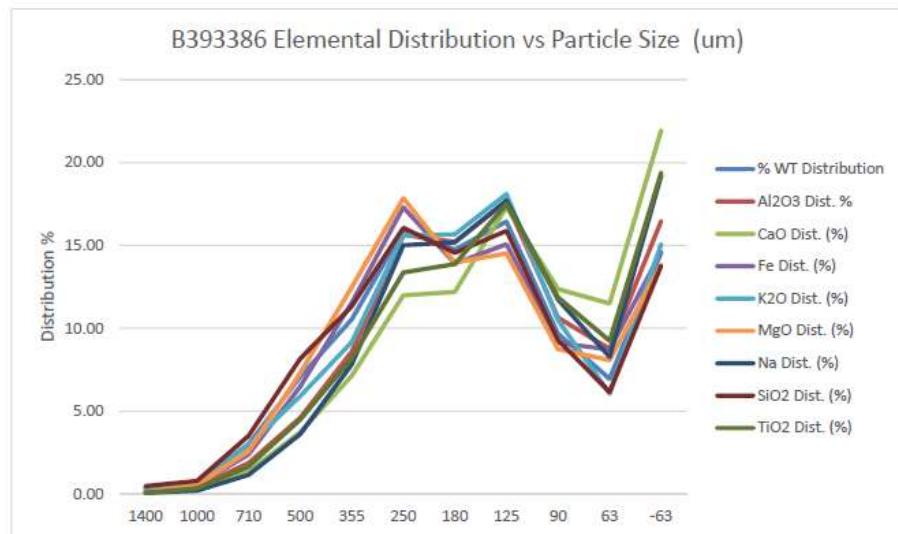

Figura 2 – Distribuição dos elementos principais encontrados nas várias frações das areias do Vale da Gaia.

5. Análise Mineralógica

Uma fração da mesma amostra foi submetida ao laboratório de mineralogia da ALS Metallurgy na Austrália para análise semi-quantitativa por difração de raios X (tabela abaixo) e no relatório oficial da ALS em anexo.

Tabela 2 – Mineralogia das areias do Vale da Gaia.

Mineral or mineral group	Sample 3
	B393386
Clay mineral	2
Chlorite	< 1
Kaolinite	4
Serpentine	1
Stilpnomelane and/or sepiolite	1
Annite - biotite - phlogopite	2
Lepidolite	13
Muscovite	4
Sodic plagioclase	43
K-feldspar	16
Topaz	< 1
Beryl	< 1
Quartz	13
Dolomite and/or epidote	0
Calcite	< 1
Anatase	< 1

3. RESULTADOS

As areias do Vale da Gaia podem ser descritas como arcoses (+25% de feldspatos), baixo conteúdo argilosos, composta maioritariamente por fragmentos de litologias de origem ígnea, com fragmentos de minerais de rochas ígneas mais evoluídas (pegmatitos e/ou aplitos) contendo valores consideráveis de lepidolite. Não se tendo encontrado na amostra cassiterite.

1. INTRODUCTION

Three (3) samples were received for sizing, assay, mineralogy, and magnetic separation to determine if significant quantities of feldspar were present and if the feldspar concentrations could be upgraded and/or impurities removed.

The testwork was controlled by Mr John Morris Pereira, on behalf of SOPRED S.A., with Mr Russell Philip supervising the program on behalf of ALS Metallurgy Services. Testwork results were communicated to the client immediately when available, which enabled the program to progress on a fully informed basis.

The purpose of this report is to describe the testwork program and present results together with some commentary and observations.

2. THE SAMPLES

Three samples labelled, B393012, B393029, and B393386 were received.

Sub-samples of each sample were split for sizing, mineralogy, and magnetic separation.

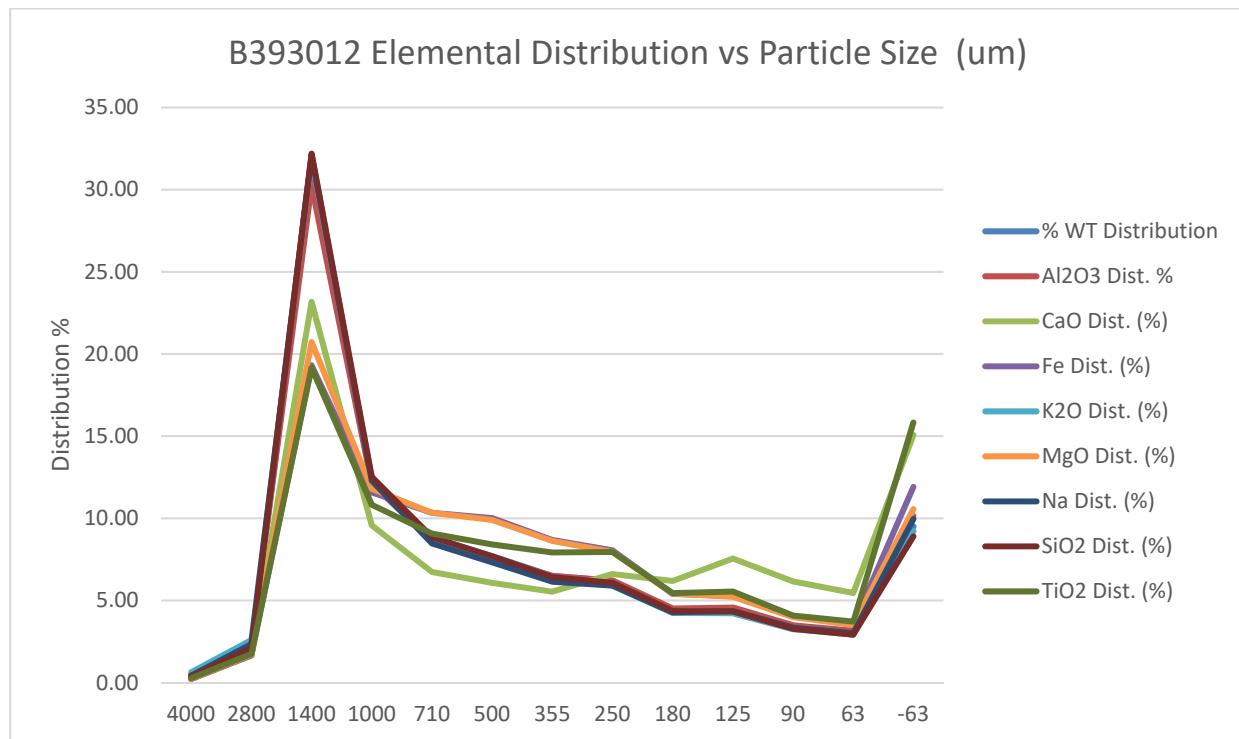

3. SIZING

Each sample was dry-screened over a stack of laboratory screens on a *Rotap* screen shaker for 10 minutes. The various fractions were recovered and sent for assay at the ALS Metallurgy in-house laboratory.

The sizing data are appended below. Combined sizing and assay data are attached as Appendix I.

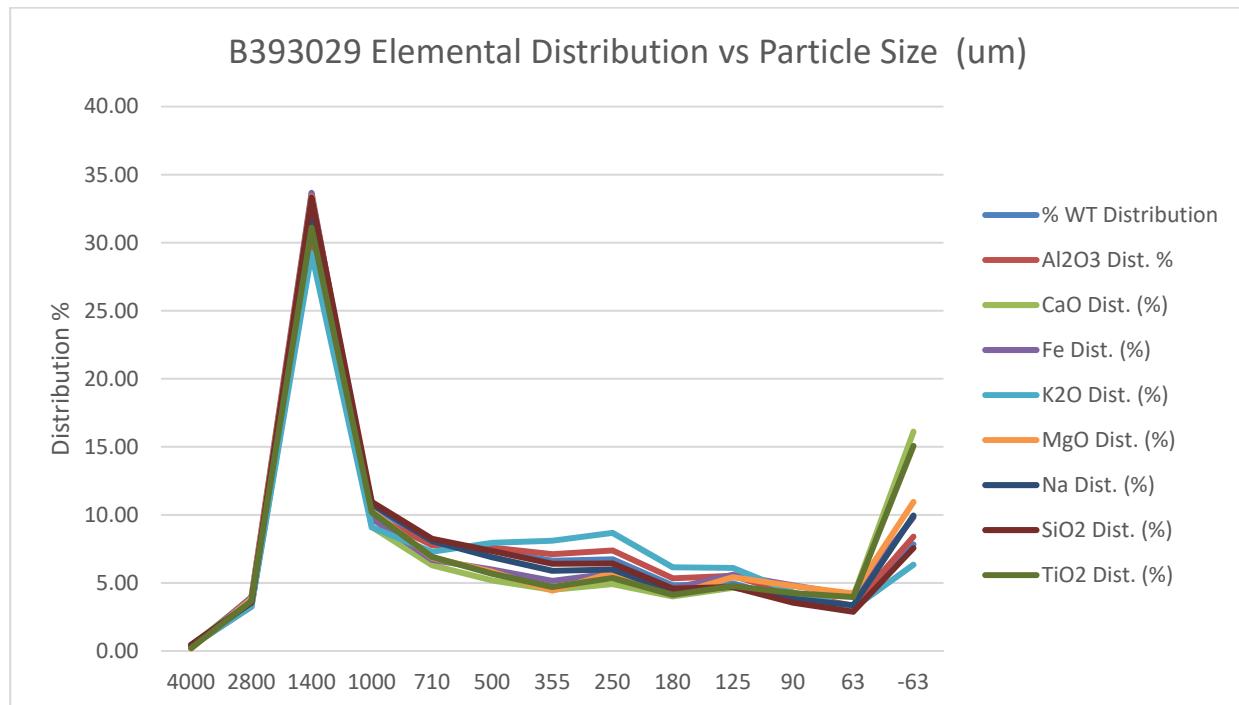

Sample #	Sample ID	Screen Size (μm)	Screen Wt (g)	Wt Distribution (%)
HL65553	B393012 + 4000 μm	4000	2.1	0.40
HL65554	B393012 + 2800 μm	2800	11.2	2.15
HL65555	B393012 + 1400 μm	1400	161.2	30.93
HL65556	B393012 + 1000 μm	1000	64.4	12.36
HL65557	B393012 + 710 μm	710	46.1	8.84
HL65558	B393012 + 500 μm	500	40.2	7.71
HL65559	B393012 + 355 μm	355	33.9	6.50
HL65560	B393012 + 250 μm	250	32.3	6.20
HL65561	B393012 + 180 μm	180	23.3	4.47
HL65562	B393012 + 125 μm	125	23.3	4.47
HL65563	B393012 + 90 μm	90	17.8	3.42
HL65564	B393012 + 63 μm	63	15.9	3.05
HL65565	B393012 -63 μm	-63	49.5	9.50
TOTAL			521.2	100.00

The following chart shows that the distribution of Al, K, Na, and Si closely follows the mass distribution for B939012. This is a relatively coarse sample with ~46% of the mass found in the +1 mm fractions.

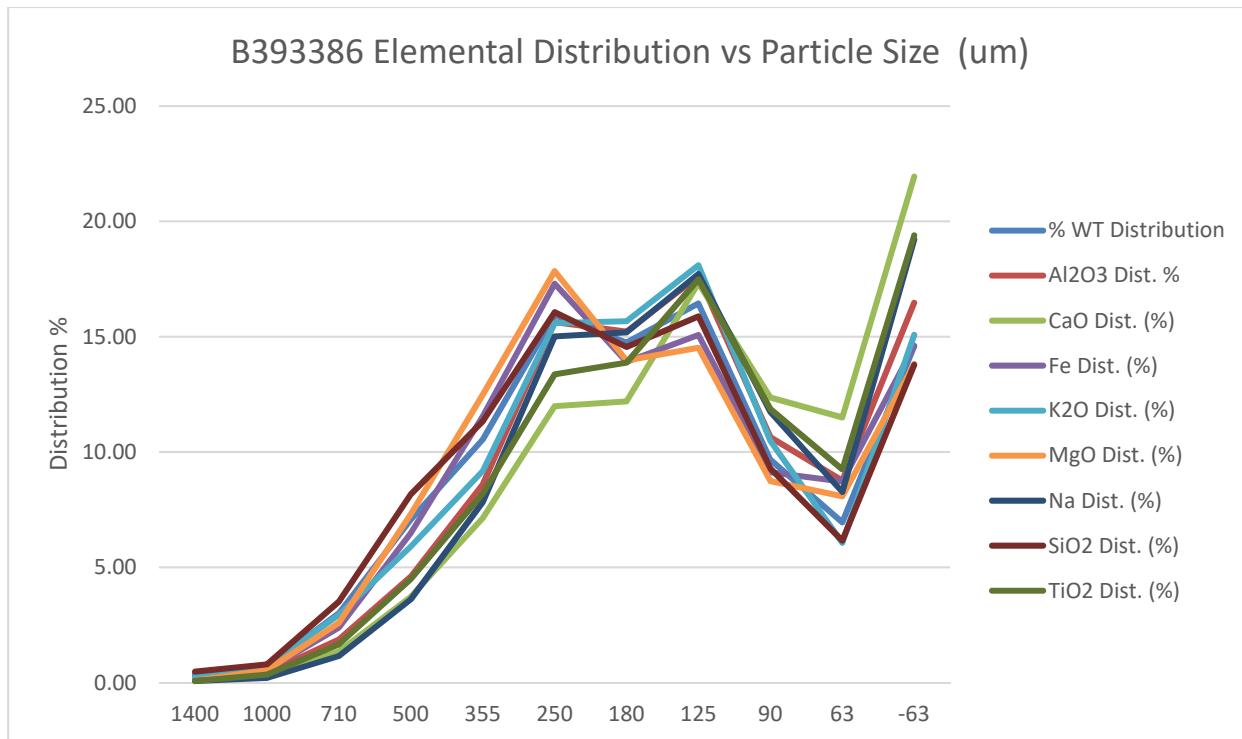

Sample #	Sample ID	Screen Size (μm)	Screen Wt (g)	Wt Distribution (%)
HL65566	B939029 + 4000 μm	4000	2.4	0.42
HL65567	B939029 + 2800 μm	2800	19.8	3.49
HL65568	B939029 + 1400 μm	1400	183.3	32.33
HL65569	B939029 + 1000 μm	1000	60.1	10.60
HL65570	B939029 + 710 μm	710	45.7	8.06
HL65571	B939029 + 500 μm	500	41.8	7.37
HL65572	B939029 + 355 μm	355	37.6	6.63
HL65573	B939029 + 250 μm	250	38.2	6.74
HL65574	B939029 + 180 μm	180	27.3	4.81
HL65575	B939029 + 125 μm	125	28.1	4.96
HL65576	B939029 + 90 μm	90	21.2	3.74
HL65577	B939029 + 63 μm	63	17.1	3.02
HL65578	B939029 -63 μm	-63	44.4	7.83
TOTAL			567.0	100.00

For sample B393029, the distribution of elements trends to the mass distribution, but is not as closely aligned as observed in B393012, particularly in the -1 mm fractions. The sample is similar in size distribution to B393012, with ~48% of the sample found in the +1 mm fractions.

Sample #	Sample ID	Screen Size (μm)	Screen Wt (g)	Wt Distribution (%)
HL65579	B393386 + 1400 μm	1400	1.9	0.37
HL65580	B393386 + 1000 μm	1000	3.5	0.68
HL65581	B393386 + 710 μm	710	15.4	3.01
HL65582	B393386 + 500 μm	500	36.2	7.07
HL65583	B393386 + 355 μm	355	54.0	10.54
HL65584	B393386 + 250 μm	250	81.6	15.93
HL65585	B393386 + 180 μm	180	75.5	14.74
HL65586	B393386 + 125 μm	125	84.2	16.44
HL65587	B393386 + 90 μm	90	49.5	9.67
HL65588	B393386 + 63 μm	63	35.6	6.95
HL65589	B393386 -63 μm	-63	74.7	14.59
TOTAL			512.1	100.00

B393386 is a much finer sample than B393012 and B393029, with no material found in the +2.8 mm fractions and 89% of the sample found in the -0.5 mm fractions. The elemental distributions are broadly in line with the particle size distribution.

4. MAGNETIC SEPARATION TESTWORK

4.1 Test Procedure

The test procedure was as follows:

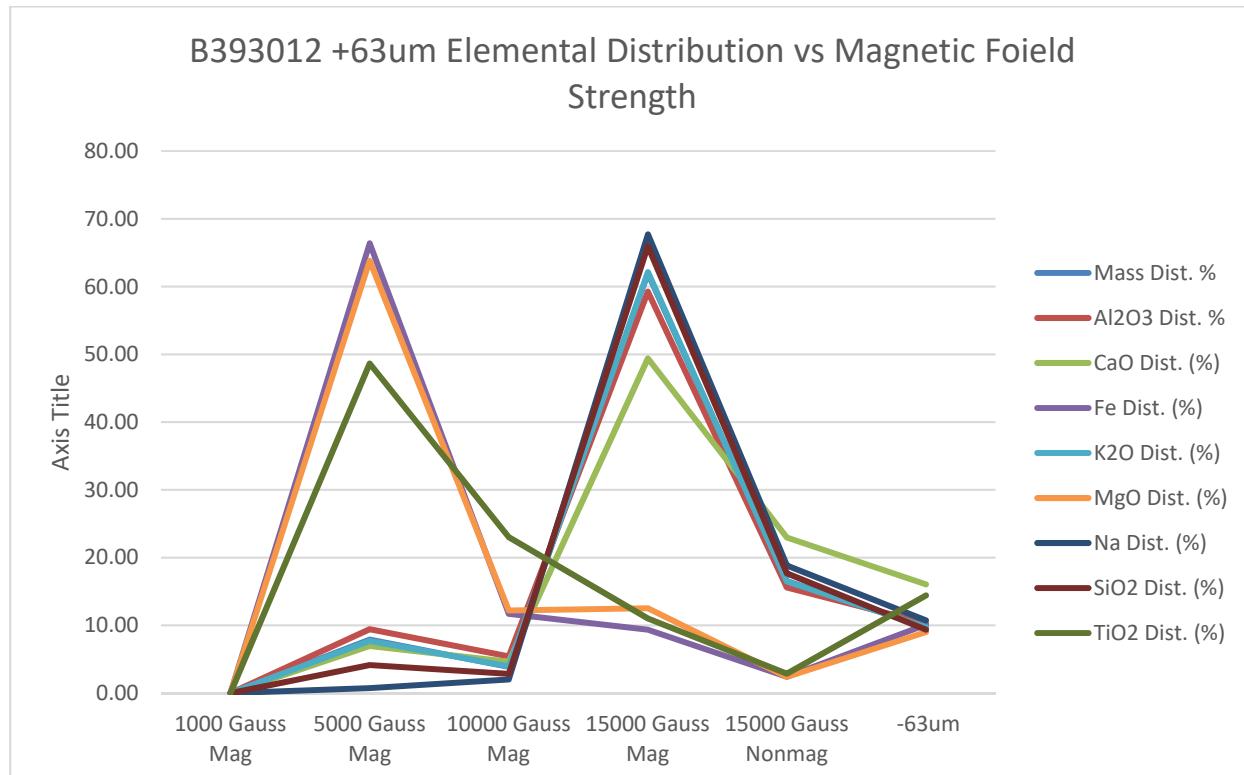

- (1) Sub-samples of each sample were crushed to P_{100} 1 mm and dry-screened at 63 μm .
- (2) The -1/+0.063 mm fractions were subjected to magnetic separation at 1,000, 5,000, 10,000, and 15,000 gauss utilising a *Mecal* Disc Magnet.
- (3) The non-magnetic fraction from each separation was passed forward to the next higher field strength.
- (4) Sub-samples of each magnetic fraction were assayed at the ALS Metallurgy in-house laboratory.
- (5) For calculation purposes, the -63 μm assays from the original head sizing have been used.

4.2 Test Results

The magnetic separation results are tabulated below. The combined magnetic separation and assay data are attached as Appendix II.

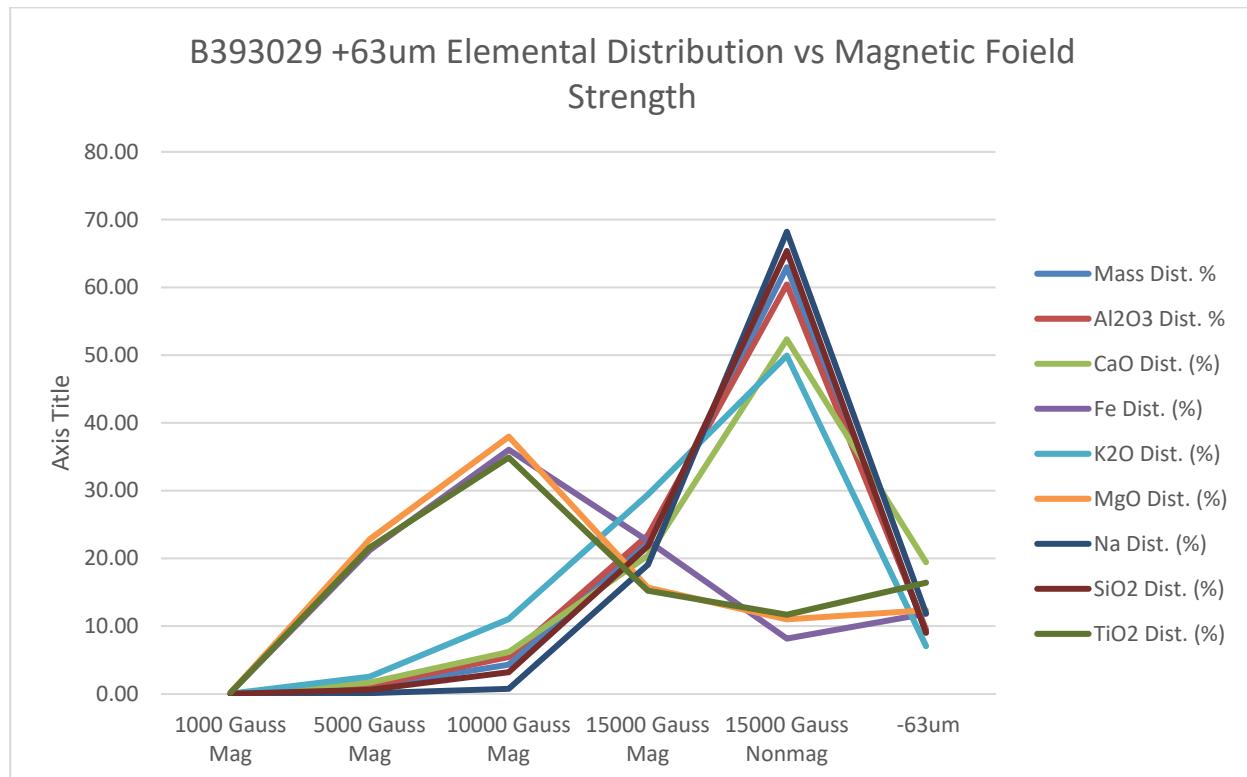

Sample #	Sample ID	Mass	%
HL65590	B393012 +63 μm 1,000 gauss Mag	0.08	0.01
HL65591	B393012 +63 μm 5,000 gauss Mag	76.97	7.90
HL65592	B393012 +63 μm 10,000 gauss Mag	37.72	3.87
HL65593	B393012 +63 μm 15,000 gauss Mag	603.64	61.95
HL65594	B393012 +63 μm 15,000 gauss Non-mag	161.12	16.54
HL65595	B393012 -63 μm	94.8	9.73
TOTAL/CALCULATED HEAD		974.33	100.00

There was minimal recovery to the 1,000 gauss magnetics. This fraction was combined with the 5,000 gauss magnetic fraction for assay. Separations up to 10,000 gauss recovered ~75% of the Fe, Mg, and Ti to the magnetic fraction.

Sample #	Sample ID	Mass	%
HL65596	B393029 +63 µm 1,000 gauss Mag	0.09	0.01
HL65597	B393029 +63 µm 5,000 gauss Mag	10.08	1.03
HL65598	B393029 +63 µm 10,000 gauss Mag	42.32	4.32
HL65599	B393029 +63 µm 15,000 gauss Mag	219.81	22.45
HL65600	B393029 +63 µm 15,000 gauss Non-mag	616.6	62.96
HL65601	B393029 -63 µm	90.4	9.23
TOTAL/CALCULATED HEAD		979.3	100.00

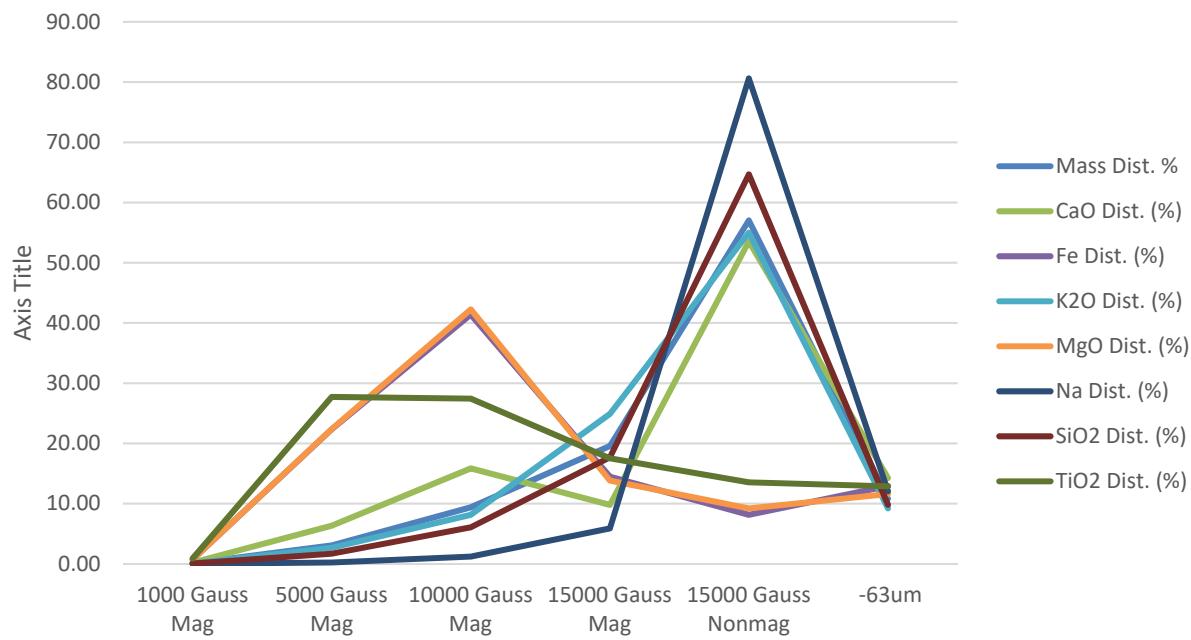

There was minimal recovery to the 1,000 gauss magnetics. This fraction was combined with the 5,000 gauss magnetic fraction for assay. The magnetic separation of this sample was slightly less effective, removing approximately 58-60% of the Fe, Mg, and Ti to the magnetics at 10,000 gauss.

Sample #	Sample ID	Mass	%
HL65602	B393386 +63 µm 1,000 gauss Mag	0.98	0.10
HL65603	B393386 +63 µm 5,000 gauss Mag	30.61	3.06
HL65604	B393386 +63 µm 10,000 gauss Mag	93.77	9.38
HL65605	B393386 +63 µm 15,000 gauss Mag	195.66	19.58
HL65606	B393386 +63 µm 15,000 gauss Non-mag	569.88	57.03
HL65607	B393386 -63 µm	108.3	10.84
TOTAL/CALCULATED HEAD		979.3	100.00

The 1,000 gauss magnetic fraction was destroyed in assay. For the purposes of calculation, it has been assumed to be the same as the 5,000 gauss magnetic fraction. Approximately 65% of the Fe and Mg and 56% of the Ti were removed to magnetics at 10,000 gauss.

B393386 +63um Elemental Distribution vs Magnetic Foield Strength

On receiving the results of the magnetic separations, the client requested an additional separation on B393012 in the size range 2.8/+1.4 mm. A sub-sample was recovered from the original particle size distribution test products. Due to equipment limitations with the *Mecal*, the sample was separated by WHIMS at 10,000 gauss using a 6 mm matrix and a 150 RPM pulse rate.

Sample ID - WHIMS Testwork	Mass (g)	%
B393012 -2800/+ 1400 µm 10,000 gauss Mag	15.93	10.75
B393012 -2800/+ 1400 µm 10,000 gauss Non-Mag	132.25	89.25
TOTAL/CALCULATED HEAD	148.18	100.00

Results were similar to those found on the finer fraction, with just under 11% reporting to the 10,000 gauss magnetic fraction containing approximately 62.5% of the Fe and Ti, and 56.6% of the Mg.

The complete separation and assay data are attached as Appendix III.

5. MINERALOGICAL ANALYSIS

A head fraction for each sample was submitted to the ALS Metallurgy in-house mineralogy laboratory for semi-quantitative XRD analysis. The mineralogy report MIN4892 is attached as Appendix IV.

On completion of the magnetic separation testwork, the client requested that the 15,000 gauss magnetics and non-magnetics for each sample be submitted for semi-quantitative XRD analysis. The mineralogy report MIN4935 is attached as Appendix V.

6. ANALYTICAL

All analytical testwork was undertaken at the ALS Metallurgy in-house laboratory. Results are tabulated in the various appendices.

APPENDIX IV

Mineralogical Analysis

Report MIN4892

A22066 (MIN4892) SOPRED

SAMPLES RECEIVED

Three samples were submitted to ALS Metallurgy for semi-quantitative XRD analysis.

Sample 1	B393012
Sample 2	B393029
Sample 3	B393386

SAMPLE PREPARATION

The samples were pressed into a back-packed sample holder to minimise preferred orientation of the particles. Powder X-ray diffraction (XRD) was used to analyse each sample and a combination of matrix flushing and reference intensity ratio (RIR) derived constants was used in the quantification of the minerals identified in each sample.

ANALYTICAL PROCEDURES

The XRD traces were collected under the following instrument conditions:

XRD	Panalytical Empyrean
Radiation	Co K α 1.789
Generator	40 kV 40 mA
Angular Range	5° to 77° 2 θ
Time/Step	120 s
Step Size	0.0131° 2 θ
Divergence Slit	0.5 °
Anti-Scatter Slit	7.5 mm
Slit Type	Fixed
Detector	PIXcel in linear mode
Rotation Speed	60 rpm

SAMPLES SUBMITTED BY

Russell Philip (ALS Metallurgy)

ANALYSIS UNDERTAKEN BY

Karsten Winter & Amy Hoppenbrouwers (ALS Metallurgy Mineralogy)

REPORTED BY

Karsten Winter & Amy Hoppenbrouwers (ALS Metallurgy Mineralogy)

REPORT DATE

13th April 2021

RESULTS

The quantitative results shown in the table below have been normalised to 100 %, and the values shown represent the relative proportion of the crystalline material in the sample. Totals greater or smaller than 100 % are due to rounding errors.

Results in the table preceded by an asterisk indicate normally a larger than usual uncertainty in regard to the quantity of the phase reported; for some of the minor and trace phases it might also indicate an uncertainty in regard of the phase itself, or both.

Mineral or mineral group	Sample 1	Sample 2	Sample 3
	B393012	B393029	B393386
	Mass %		
Clay mineral	1	< 1	2
Chlorite	2	< 1	< 1
Kaolinite	< 1	< 1	4
Serpentine	< 1	0	1
Stilpnomelane and/or sepiolite	0	0	1
Annite - biotite - phlogopite	12	4	2
Lepidolite	3	12	13
Muscovite	4	3	4
Sodic plagioclase	21	57	43
K-feldspar	32	1	16
Topaz	< 1	1	< 1
Beryl	0	< 1	< 1
Quartz	25	20	13
Dolomite and/or epidote	0	0	0
Calcite	1	0	< 1
Anatase	0	1	< 1

COMMENTS

Sample B393012 might contain a trace of hematite and/or pyrite.
Some amorphous material is possibly present.

APPENDIX V

Mineralogical Analysis

Report MIN4935

A22066 (MIN4935) SOPRED

SAMPLES RECEIVED

Six samples were submitted to ALS Metallurgy for semi-quantitative XRD analysis.

Sample 1	HL65593
Sample 2	HL65594
Sample 3	HL65599
Sample 4	HL65600
Sample 5	HL65605
Sample 6	HL65606

SAMPLE PREPARATION

The samples were pressed into a back-packed sample holder to minimise preferred orientation of the particles. Powder X-ray diffraction (XRD) was used to analyse each sample and a combination of matrix flushing and reference intensity ratio (RIR) derived constants was used in the quantification of the minerals

ANALYTICAL PROCEDURES

The XRD traces were collected under the following instrument conditions:

XRD	Panalytical Empyrean
Radiation	Co K α 1.789
Generator	40 kV 40 mA
Angular Range	5° to 77° 2 θ

RESULTS

The quantitative results shown in the table below have been normalised to 100 %, and the values shown represent the relative proportion of the crystalline material in the sample. Totals greater or smaller than 100 % are due to rounding errors.

Results in the table preceded by an asterisk indicate normally a larger than usual uncertainty in regard to the quantity of the phase reported; for some of the minor and trace phases it might also indicate an uncertainty in regard of the phase itself, or both.

Mineral or mineral group	Sample 1	Sample 2	Sample 3	Sample 4	Sample 5	Sample 6
	HL65593	HL65594	HL65599	HL65600	HL65605	HL65606
	Mass %					
Clay Mineral	<1	<1	0	0	0	0
Chlorite	<1	<1	<1	<1	1	<1
Kaolinite	0	<1	0	0	4	1
Serpentine	0	0	0	0	1	<1
Stilpnomelane and/or Sepiolite	0	0	0	0	1	0
Annite - biotite - phlogopite	2	1	6	0	5	2
Lepidolite	1	1	10	6	24	6
Muscovite	4	1	0	0	0	1
Sodic Plagioclase	24	25	61	70	6	41
K-feldspar	37	43	2	1	8	26
Topaz	0	1	0	1	0	1
Quartz	29	23	21	22	18	19
Dolomite and/or epidote	0	1	0	0	0	0
Calcite	1	1	0	0	0	0

COMMENTS

'Mica' represents micas from both the biotite - annite - phlogopite group, muscovite (+/- Li) and also lepidolite.

'Clay mineral' seems to be predominantly vermiculite and smectite, with some palygorskite possibly present.

Samples HL65599 and HL65600 might contain a trace of beryl.

Some amorphous likely present in all samples.
